

Javascript

AKA what makes websites cool

What's Javascript?

- Programming language
- Created in 1995
- Used mostly on websites
- Essential for web development alongside **HTML** and **CSS**
- Not related to the Java language

What does Javascript do?

- It lets the user interact with a page
- It can change the content of a web page

Example: [w3schools](https://www.w3schools.com)

How do we use Javascript?

You can put it inside an HTML document with the

<script>

tag!

- Can be placed in the **head** and/or **body** tags

Let's try out Javascript!

1. Create an HTML document called **testingjavascript.html**
2. Create **html**, **title**, **head**, and **body** tags
3. Title it "Using Javascript"
4. Write this under **<body>** and above **</body>**

```
<script>
```

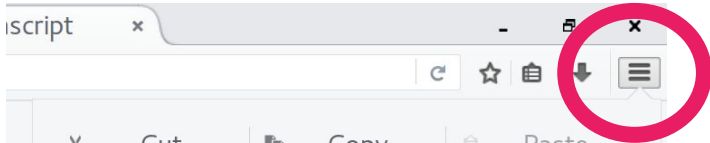

```
    console.log("Hello world!");
```

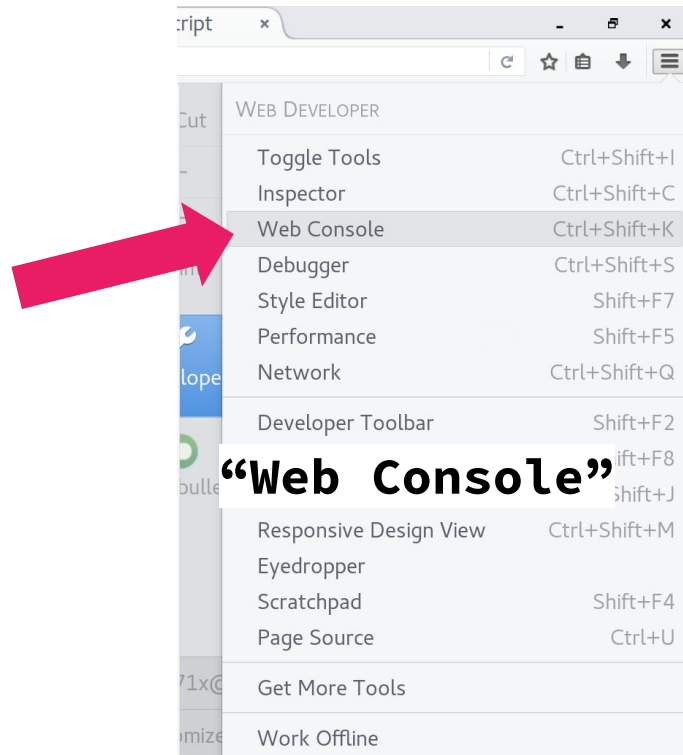

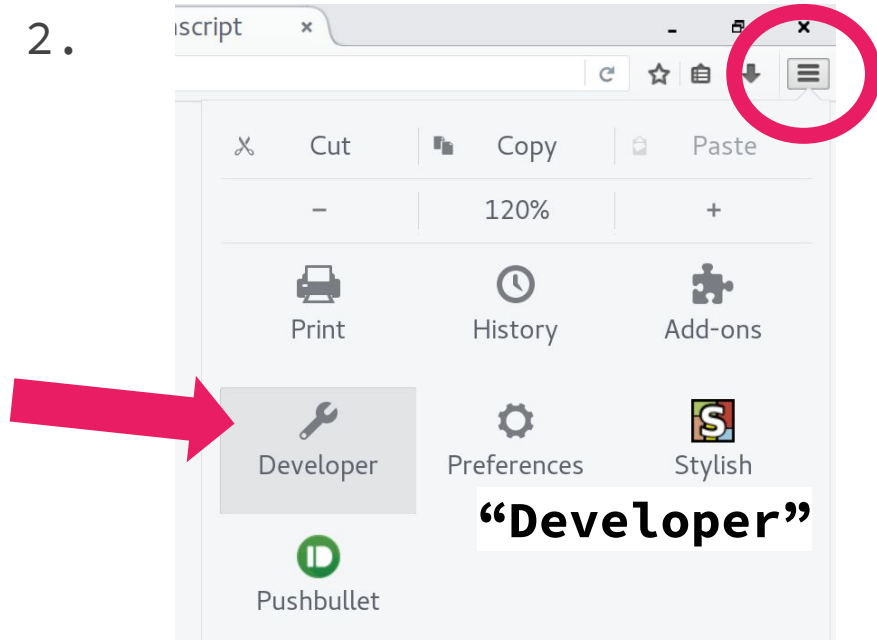

```
</script>
```

Put this inside your **<head>**
<meta charset="utf-8">

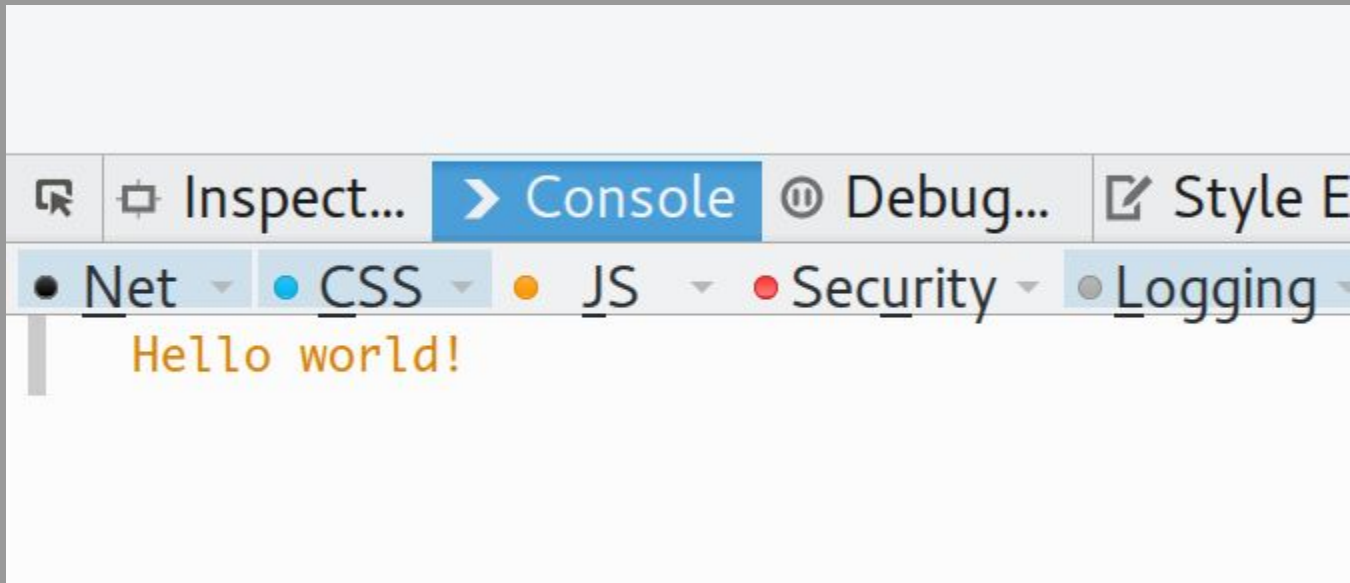

Let's try out Javascript - pt. II

1. Open your file in **firefox**.

2.  3.
